1 Global Weather Analysis

1.0.1 PM Accelerator Mission:

By making industry-leading tools and education available to individuals from all backgrounds, we level the playing field for future PM leaders. This is the PM Accelerator motto, as we grant aspiring and experienced PMs what they need most – Access. We introduce you to industry leaders, surround you with the right PM ecosystem, and discover the new world of AI product management skills.

1.1 Library Installation and Import

[2]:
```
!pip install -r ../requirements.txt
```

```
Requirement already satisfied: ipython-autotime in
/usr/local/lib/python3.11/dist-packages (from -r ../requirements.txt (line 1))
(0.3.2)
Requirement already satisfied: folium in /usr/local/lib/python3.11/dist-packages
(from -r ../requirements.txt (line 2)) (0.19.4)
Requirement already satisfied: ipython in /usr/local/lib/python3.11/dist-
packages (from ipython-autotime->-r ../requirements.txt (line 1)) (8.20.0)
Requirement already satisfied: branca>=0.6.0 in /usr/local/lib/python3.11/dist-
packages (from folium->-r ../requirements.txt (line 2)) (0.8.1)
Requirement already satisfied: jinja2>=2.9 in /usr/local/lib/python3.11/dist-
packages (from folium->-r ../requirements.txt (line 2)) (3.1.3)
Requirement already satisfied: numpy in /usr/local/lib/python3.11/dist-packages
(from folium->-r ../requirements.txt (line 2)) (1.26.3)
Requirement already satisfied: requests in /usr/local/lib/python3.11/dist-
packages (from folium->-r ../requirements.txt (line 2)) (2.31.0)
Requirement already satisfied: xyzservices in /usr/local/lib/python3.11/dist-
packages (from folium->-r ../requirements.txt (line 2)) (2024.9.0)
Requirement already satisfied: MarkupSafe>=2.0 in
/usr/local/lib/python3.11/dist-packages (from jinja2>=2.9->folium->-r
../requirements.txt (line 2)) (2.1.4)
Requirement already satisfied: decorator in /usr/local/lib/python3.11/dist-
packages (from ipython->ipython-autotime->-r ../requirements.txt (line 1))
(5.1.1)
Requirement already satisfied: jedi>=0.16 in /usr/local/lib/python3.11/dist-
```

```
packages (from ipython->ipython-autotime->-r ../requirements.txt (line 1))
(0.19.1)

```
duplicates_count = df.duplicated().sum()

# Check if there are any duplicate rows and print the result using f-strings
if df.duplicated().any():
    print(f"Duplicates are present. Total duplicate rows: {duplicates_count}")
else:
    print(f"No duplicates are present in the Dataset.")
```

```
No duplicates are present in the Dataset.
time: 82.2 ms (started: 2025-01-16 01:13:13 +00:00)
```

1.2.3 Check Infinity Values

[8]:
```
# Check for inf values in numeric columns only
numeric_columns = df.select_dtypes(include=[np.number]).columns
inf_values_count = np.isinf(df[numeric_columns]).sum().sum()

# Check if there are any inf values and print the result
if inf_values_count > 0:
    print(f"Inf values are present. Total inf values: {inf_values_count}")
else:
    print(f"No inf values are present in the Dataset.")
```

```
No inf values are present in the Dataset.
time: 7.74 ms (started: 2025-01-16 01:13:13 +00:00)
```

1.2.4 Outlier Detection and Boxplot Visualization

This process involves detecting and removing outliers using the IQR (Interquartile Range) method, followed by boxplot visualization to understand the cleaned dataset.

- **Data Selection and Preparation**
  - Identifies numeric columns in the DataFrame using `select_dtypes()`
  - Creates an initial boolean mask for tracking outliers across all columns
- **Outlier Detection**
  - Calculates Q1 (25th percentile) and Q3 (75th percentile) for each numeric column
  - Computes IQR (Interquartile Range) and defines outlier boundaries using the 1.5 * IQR rule
  - Marks data points outside these boundaries as outliers in the mask
- **Data Cleaning**
  - Creates a new DataFrame `df_no_outliers` by filtering out the identified outliers using the mask
- **Visualization Setup**
  - Calculates the required number of rows and columns for subplot layout
  - Creates a figure with appropriate plot which is maximum of 5 plots per row.
- **Boxplot Creation**
  - Generates boxplots for each numeric column in the cleaned dataset

- Adds red dashed lines for lower bounds and blue dashed lines for upper bounds
- Includes titles and legend for each subplot
- Uses `tight_layout()` for proper spacing and displays the plots

[54]:
```
# Select numeric columns
numerical_columns = df.select_dtypes(include=['number']).columns

# Create a boolean mask for outliers
outlier_mask = pd.Series(False, index=df.index)

# Calculate IQR and identify outliers
for column in numerical_columns:
    Q1 = df[column].quantile(0.25)
    Q3 = df[column].quantile(0.75)
    IQR = Q3 - Q1
    lower_bound = Q1 - 1.5 * IQR
    upper_bound = Q3 + 1.5 * IQR

    # Update the outlier mask
    outlier_mask |= (df[column] < lower_bound) | (df[column] > upper_bound)

# Create a new DataFrame without outliers
df_no_outliers = df[~outlier_mask]
df_no_outliers = df_no_outliers.reset_index()

# Set custom color palette
custom_palette = ['#3498db', '#2ecc71', '#e74c3c', '#f1c40f', '#9b59b6',
                  '#1abc9c', '#e67e22', '#34495e', '#7f8c8d', '#16a085']

# Set up the matplotlib figure with a light background
plt.rcParams['figure.facecolor'] = '#f5f5f5'
plt.rcParams['axes.facecolor'] = 'white'

# Create figure
num_cols = 5
num_rows = (len(numerical_columns) + num_cols - 1) // num_cols
fig = plt.figure(figsize=(20, num_rows * 4), dpi=300)

# Create boxplots for the DataFrame without outliers
for i, column in enumerate(numerical_columns):
    Q1 = df_no_outliers[column].quantile(0.25)
    Q3 = df_no_outliers[column].quantile(0.75)
    IQR = Q3 - Q1
    lower_bound = Q1 - 1.5 * IQR
    upper_bound = Q3 + 1.5 * IQR

    ax = plt.subplot(num_rows, num_cols, i + 1)
```

```python
    # Create boxplot with custom style
    bp = sns.boxplot(y=df_no_outliers[column],
                     color=custom_palette[i % len(custom_palette)],
                     width=0.5,
                     linewidth=2,
                     fliersize=5,
                     showfliers=True)

    # Customize the box properties
    for box in bp.artists:
        box.set_alpha(0.7)
        box.set_edgecolor('black')

```

1.3.3 Use 'last_updated' as index

use last_update as index time series and drop unnecessary columns such as 'index', 'last_updated_epoch'

[63]:
```python
# Convert 'last_updated' to datetime format
df_no_outliers['last_updated'] = pd.to_datetime(df_no_outliers['last_updated'])

# Extracting temporal features
df_no_outliers['year'] = df_no_outliers['last_updated'].dt.year
df_no_outliers['month'] = df_no_outliers['last_updated'].dt.month
df_no_outliers['day'] = df_no_outliers['last_updated'].dt.day
df_no_outliers['hour'] = df_no_outliers['last_updated'].dt.hour

# Set 'last_updated' as the index
df_no_outliers.set_index('last_updated', inplace=True)

# Sort by index if needed
df_no_outliers.sort_index(inplace=True)

# Drop columns
df_no_outliers = df_no_outliers.drop(columns=['index', 'last_updated_epoch'])

# Display the result
df_no_outliers
```

[63]:

1.3.5 HeatMap Location based on Temperature

[17]:
```
# Create a Folium map centered at a specific latitude and longitude
m = folium.Map(location=[0, 0], zoom_start=2)  # You can adjust the coordinates␣
 ↪and zoom level

# Create a list of coordinates and corresponding values (e.g., temperature)
locations = df_no_outliers[['latitude', 'longitude']].values
values =  df_no_outliers['temperature_celsius'].values
```

```
# Normalize the values for the heatmap (adjust as needed)
max_value = max(values)
normalized_values = [v / max_value for v in values]

# Create a HeatMap layer on the map
HeatMap(list(zip(locations[:, 0], locations[:, 1], normalized_values))).
 ↪add_to(m)

# Display the map in the jupyter notebook
display(m)
```

```
<folium.folium.Map at 0x7ff05255a890>
```

```
time: 378 ms (started: 2025-01-16 01:13:22 +00:00)
```

1.3.6 Daily Global Precipitation Trends

[18]:

```
# Filter for object columns
object_columns = df_no_outliers.select_dtypes(include='object')

# Resample to daily frequency by taking the mean of the temperature for each day
df_daily = df_no_outliers.drop(columns=object_columns)

df_daily = df_daily.resample('D').mean()

# Calculate the mean of the temperature celcius series (ignoring NaN)
mean_value = df_daily['precip_mm'].mean()

# Replace the specific value 7.1 with the mean
df_daily = df_daily.replace(7.1, mean_value)

# Forward fill
df_daily = df_daily.fillna(method='ffill')

# Calculate the rolling average
rolling_window = 30  # Set the window size (e.g., 30 days for a monthly average)
rolling_avg = df_daily['precip_mm'].rolling(window=rolling_window).mean()

# Plot the overall temperature trend with the rolling average
plt.figure(figsize=(12, 5))
sns.set(style="whitegrid")

# Plot the overall trend
plt.plot(
    df_daily.index,
    df_daily['precip_mm'],
    label="Overall Trend",
```

```python
    alpha=0.6,
    color="grey"
)

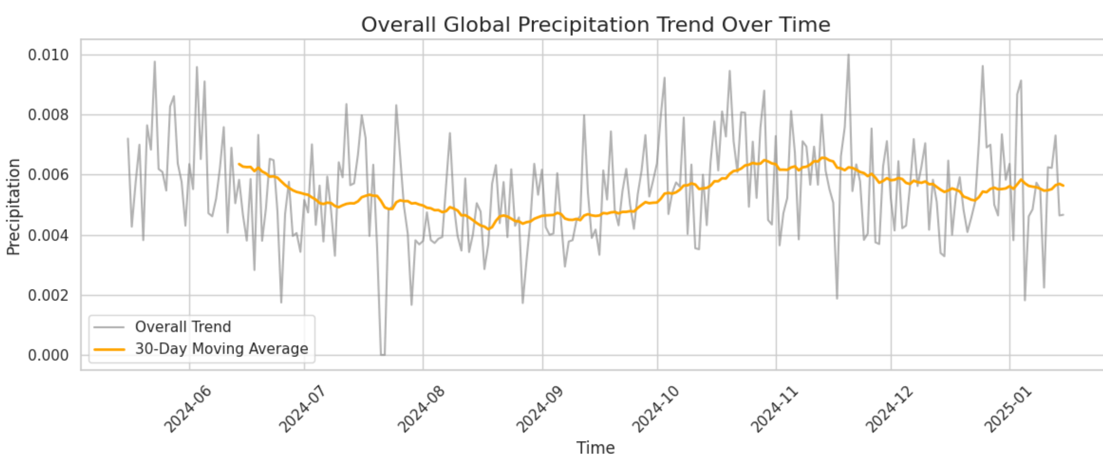
# Plot the rolling average
plt.plot(
    df_daily.index,
    rolling_avg,
    label=f"{rolling_window}-Day Moving Average",
    color="orange",
    linewidth=2
)

# Add plot details
plt.title("Overall Global Precipitation Trend Over Time", fontsize=16)
plt.xlabel("Time", fontsize=12)
plt.ylabel("Precipitation", fontsize=12)
plt.xticks(rotation=45)
plt.legend()  # Add legend for clarity
plt.tight_layout()

# Show the plot
plt.show()

# Optional: Save the plot
plt.savefig('../output/visuals/daily_global_precipitation_trends.png', dpi=300,␣
 ↪bbox_inches='tight')
```

```
/tmp/ipykernel_793/2348243888.py:16: FutureWarning: DataFrame.fillna with
'method' is deprecated and will raise in a future version. Use obj.ffill() or
obj.bfill() instead.
  df_daily = df_daily.fillna(method='ffill')
```



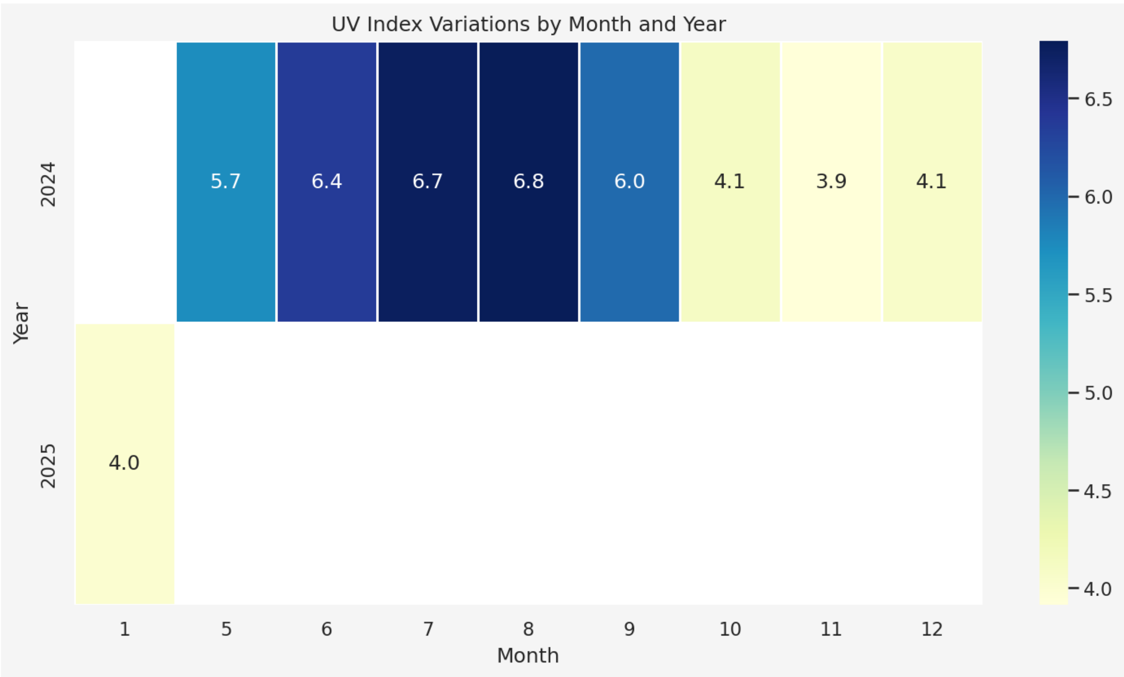
<Figure size 640x480 with 0 Axes>

time: 386 ms (started: 2025-01-16 01:13:22 +00:00)

1.3.7 UV Index Analysis

[65]:

```
# Heatmap to visualize UV index variations by month and year
uv_index_heatmap = df_no_outliers.pivot_table(values='uv_index', index='year',␣
↪columns='month', aggfunc='mean')
plt.figure(figsize=(12, 6), dpi=150)
sns.heatmap(uv_index_heatmap, cmap='YlGnBu', annot=True, fmt='.1f',␣
↪linewidths=0.5)
plt.title('UV Index Variations by Month and Year')
plt.xlabel('Month')
plt.ylabel('Year')
plt.grid(False)
plt.show()
plt.savefig('../output/visuals/UV_index.png', dpi=300, bbox_inches='tight')
```



<Figure size 640x480 with 0 Axes>

time: 343 ms (started: 2025-01-16 02:11:21 +00:00)

1.4 Feature Engineering

Search for all 'object' data and convert it into numerical data so that it can be used as a feature in machine learning models.

[20]:
```
# Filter for object columns
object_columns = df_no_outliers.select_dtypes(include='object')

# Print unique values for each object column
for col in object_columns.columns:
    print(f"Unique values in column '{col}':")
```

```
Unique values in column 'country':
Unique values in column 'location_name':
Unique values in column 'timezone':
Unique values in column 'condition_text':
Unique values in column 'wind_direction':
Unique values in column 'sunrise':
Unique values in column 'sunset':
Unique values in column 'moonrise':
Unique values in column 'moonset':
Unique values in column 'moon_phase':
time: 4.93 ms (started: 2025-01-16 01:13:23 +00:00)
```

Preprocess country, location_name, condition, moon phase, and wind direction by converting text to lowercase, then encoding unique values into numeric codes (0,1,2,…)

[21]:
```
# Convert to lowercase
df_no_outliers['condition_text'] = df_no_outliers['condition_text'].str.lower()
df_no_outliers['moon_phase'] = df_no_outliers['moon_phase'].str.lower()
df_no_outliers['wind_direction'] = df_no_outliers['wind_direction'].str.lower()
df_no_outliers['country'] = df_no_outliers['country'].str.lower()
df_no_outliers['location_name'] = df_no_outliers['location_name'].str.lower()
df_no_outliers['timezone'] = df_no_outliers['timezone'].str.lower()

# Get unique values and assign numeric codes
df_no_outliers['condition_text'] = df_no_outliers['condition_text'].
 ↪astype('category').cat.codes
df_no_outliers['moon_phase'] = df_no_outliers['moon_phase'].astype('category').
 ↪cat.codes
df_no_outliers['wind_direction'] = df_no_outliers['wind_direction'].
 ↪astype('category').cat.codes
df_no_outliers['country'] = df_no_outliers['country'].astype('category').cat.
 ↪codes
df_no_outliers['location_name'] = df_no_outliers['location_name'].
 ↪astype('category').cat.codes
```

```
df_no_outliers['timezone'] = df_no_outliers['timezone'].astype('category').cat.
↪codes
```

time: 24.5 ms (started: 2025-01-16 01:13:23 +00:00)

Preprocess all time features into numerical data

[22]:
```
def time_to_minutes(time_str):
    if time_str.lower() == 'no moonrise' or time_str.lower() == 'no moonset' or␣
↪time_str.lower() == 'no sunrise' or time_str.lower() == 'no sunset':
        return -1  # or some other placeholder value (e.g., -1)
    try:
        time_obj = pd.to_datetime(time_str, format='%I:%M %p')  # Convert to␣
↪datetime
        return time_obj.hour * 60 + time_obj.minute
    except ValueError:
        return None  # or handle other invalid time formats similarly

df_no_outliers['moonrise'] = df_no_outliers['moonrise'].apply(time_to_minutes)
df_no_outliers['moonset'] = df_no_outliers['moonset'].apply(time_to_minutes)
df_no_outliers['sunrise'] = df_no_outliers['sunrise'].apply(time_to_minutes)
df_no_outliers['sunset'] = df_no_outliers['sunset'].apply(time_to_minutes)
```

time: 5.41 s (started: 2025-01-16 01:13:23 +00:00)

[23]:
```
df_no_outliers
```

[23]:
```
                     country  location_name  latitude  longitude  timezone  \

1.4.3 Model Training

Models Overview

1. **LSTM Model**:
   - Sequence-based deep learning model.
   - Architecture includes an LSTM layer (32 units) and a Dense output layer.
   - Optimized using Adam optimizer and MSE as the loss function.
   - Early stopping applied to prevent overfitting.
2. **GRU Model**:
   - Similar structure to the LSTM model but uses a GRU layer instead.
   - Early stopping used for efficient training.
3. **XGBoost Model**:
   - Gradient boosting algorithm for regression tasks.
   - Input data reshaped into 2D format.
   - Key hyperparameters: 100 estimators, max depth of 6, learning rate 0.1, and subsample ratios of 0.8.

1.4.4 Model Evaluation

LSTM Model achieved the lowest MSE (1.082546) and lowest MAE (0.836289) among all models. Demonstrates superior accuracy in predicting the validation data.

XGBRegressor follows closely, suggesting it is also a strong candidate for the task, particularly if computational efficiency is a priority.

[35]:
```
from sklearn.metrics import mean_squared_error, mean_absolute_error

# Predictions and evaluation for LSTM model
